## ABSTRACT OF THE DISCLOSURE

2	There is disclosed a technique for creating a plug and play interface for user
3	actions on a graphical user interface (GUI) on a computer system such as might be used
4	in a client-server network. A text file is prepared in XML language containing all
5	possible user actions. The text file is read by GUI framework application software
6	running on the operating system, and the results are stored in at least one table as Java
7	code. The framework application software calls the Java code in response to user
8	requests. The technique lends itself to modularization and therefore to ease of
9	manufacture of such software plug and play interface. Such software can be easily
10	modified at any time up to runtime.
